Residential Gas Safety

For people who forget to turn the gas off

Gas Detection For Your Home

SE0303

This gas detector works on the same principle as the smoke detector in your home, but it detects gas.

When it detects gas from a stove top that has been turned on but not ignited, it will sound an alarm to warn that gas is present. It can also run in tandem with a shut off valve, that will close off the gas when the alarm sounds.

This detector needs to be installed on the wall above the stove, in direct line with the gas source.

- An electrician is required to install this product.
